# **Experiment 3**

Student Name: Lavanya

Branch: CSE

Section/Group:635/B

Semester: 6<sup>th</sup> DOP:17/1/2025

Subject: Java Lab Subject Code: 22CSH-359

**Aim:** Create an application to calculate interest for FDs, RDs based on certain conditions using inheritance.

**Objective:** To develop a Java application that calculates interest for Fixed Deposits (FDs) and Recurring Deposits (RDs) using object-oriented programming principles. The application will use inheritance to define common properties and methods for accounts while providing specific implementations for FDs and RDs based on their respective conditions.

### Algorithm:

- Create Account class with attributes: accountHolderName, principal, rateOfInterest. Include methods for calculating interest (to be overridden) and displaying details.
- Create FixedDeposit subclass that calculates FD interest using: principal \* rateOfInterest \* tenureInYears / 100. Display FD details.
- Create RecurringDeposit subclass that calculates RD interest using: (monthlyDeposit \* months \* (months + 1) / 2) \* (rateOfInterest / (12 \* 100)). Display RD details.
- In main method, create instances of FixedDeposit and RecurringDeposit and display their details.

#### Code:

```
class Account {
String accountHolderName;
double principal;
double rateOfInterest;
public Account(String accountHolderName, double principal, double rateOfInterest) {
    this.accountHolderName = accountHolderName;
    this.principal = principal;
    this.rateOfInterest = rateOfInterest;}
    public double calculateInterest() {
    return 0;
}
```

```
public void displayDetails() {
     System.out.println("Account Holder: " + accountHolderName);
    System.out.println("Principal Amount: " + principal);
    System.out.println("Rate of Interest: " + rateOfInterest + "%");
  }
}
 class FixedDeposit extends Account {
  int tenureInYears;
  public FixedDeposit(String accountHolderName, double principal, double rateOfInterest, int
  tenureInYears) {
    super(accountHolderName, principal, rateOfInterest);
    this.tenureInYears = tenureInYears;
  }
  public double calculateInterest() {
    return principal * rateOfInterest * tenureInYears / 100;
  }
    public void displayDetails() {
    super.displayDetails();
    System.out.println("Tenure (Years): " + tenureInYears);
    System.out.println("Interest Amount: " + calculateInterest());}}
  class RecurringDeposit extends Account {
  int months;
  double monthlyDeposit;
  public RecurringDeposit(String accountHolderName, double monthlyDeposit, double rateOfInterest,
  int months) {
```

```
super(accountHolderName, 0, rateOfInterest);
    this.monthlyDeposit = monthlyDeposit;
    this.months = months;
  }
  public double calculateInterest() {
    // RD interest formula: P(n(n+1)/2) * (r / 12 * 100)
    double n = months;
    return (monthlyDeposit * n * (n + 1) / 2) * (rateOfInterest / (12 * 100));
  }
  public void displayDetails() {
    System.out.println("Account Holder: " + accountHolderName);
    System.out.println("Monthly Deposit: " + monthlyDeposit);
    System.out.println("Number of Months: " + months);
    System.out.println("Rate of Interest: " + rateOfInterest + "%");
    System.out.println("Interest Amount: " + calculateInterest());
  }
public class InterestCalculator {
  public static void main(String[] args) {
    // Example FD account
    FixedDeposit fd = new FixedDeposit("Lavanya", 100000, 5.5,
    3); System.out.println("Fixed Deposit Details:");
    fd.displayDetails();
    System.out.println();
```

```
RecurringDeposit rd = new RecurringDeposit("Lavanya_22BCS50012", 5000, 6.5, 12);
System.out.println("Recurring Deposit Details:");
rd.displayDetails();
}
```

# **Output**:

```
Fixed Deposit Details:
Account Holder: Lavanya
Principal Amount: 10000.0
Rate of Interest: 5.0%
Tenure (Years): 3
Interest Amount: 1500.0

Recurring Deposit Details:
Account Holder: Lavanya_22BCS50012
Monthly Deposit: 5000.0
Number of Months: 12
Rate of Interest: 6.5%
Interest Amount: 2112.5

Process finished with exit code 0
```

### **Learning Outcomes:**

- Inheritance: Use of base and derived classes for shared attributes and methods.
- Method Overriding: Custom implementation of methods in subclasses.
- Constructor: Initializing object attributes using constructors.
- Encapsulation: Storing and manipulating data within objects.
- Polymorphism: Different behavior of calculateInterest () based on object type.
- Interest Calculation: Implementing FD and RD interest formulas.
- Class Interaction: Creating objects and calling methods to display details
